

5.1

A component based architecture is the pieces of the system are loosely coupled components and the components provide service for each other. All the pieces are all contained in the same executable program so they communicate directly instead of across network.

A service oriented architecture is similar to component based architecture but the pieces are implemented as services and it is often running on separate computers and communicate across network such as web services.

5.2

Architectures that would be most appropriate are:

1. Monolithic because it's simple and self contained.
2. Data Centric because in tic tac toe it's easy to build tables of moves and the best response.
3. Event Driven for handling the user interface interactions.

5.4

Architectures that would be most appropriate are:

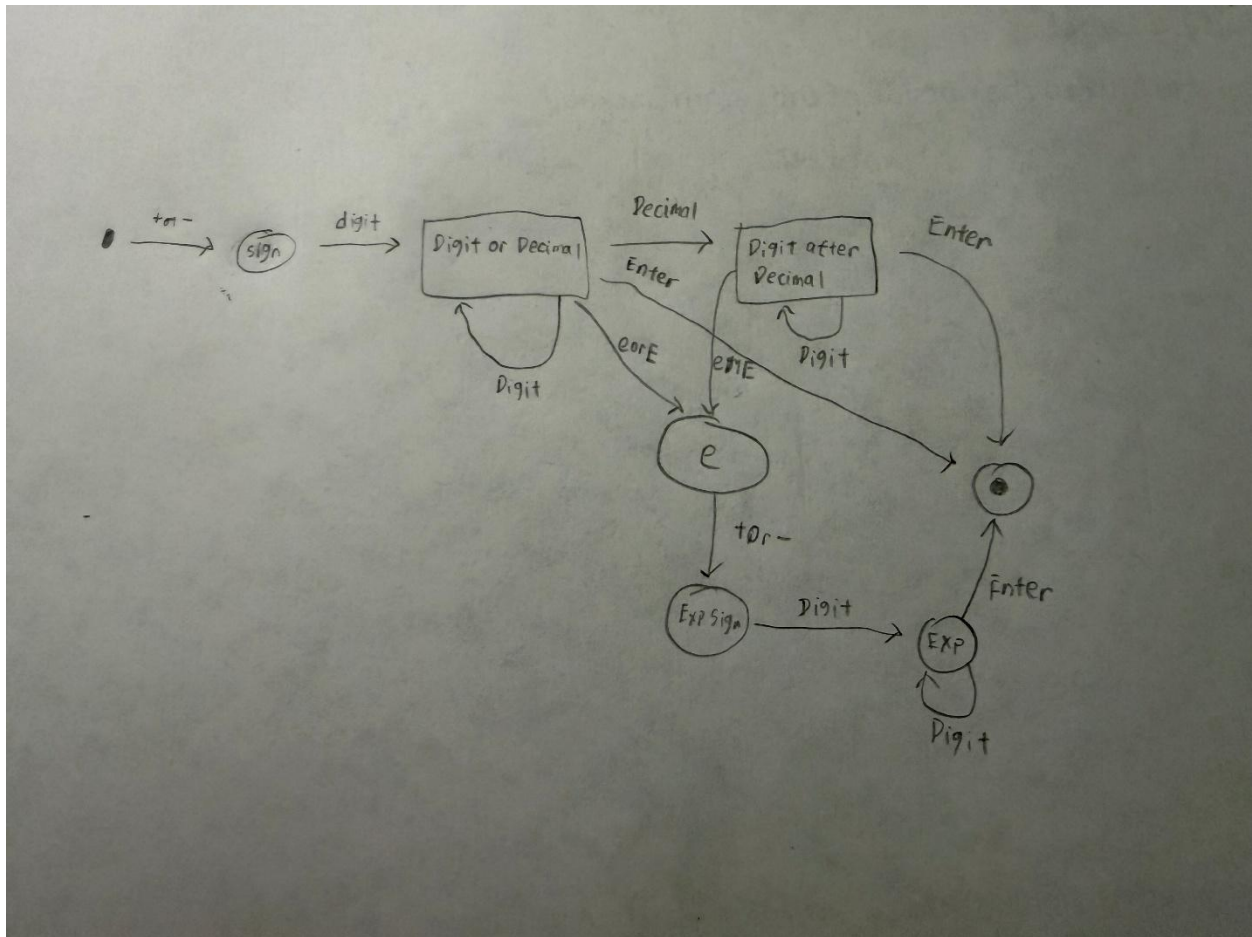

1. Monolithic because it's simple.
2. Data Centric used for store game state and moves.
3. Service Oriented for the web service and Internet.

5.6

For the database structure the ClassyDraw application can just store the drawing on separate file like MS Paint or photoshop can store in .png or .jpg.

For the maintenance using the operating system tool to let the user manage the files (delete, backup, organize).

5.8

6.1

1. Properties these classes all share:

- ForeColor (foreground color)
- BackColor (background color)
- UpperLeft (position)
- Width
- Height

2. Properties they do not share:

- Font - only Text
- String - only Text
- NumPoints - only Star

3. Properties Shared by some classes:

- FillColor - Rectangle, Ellipse, Star (NOT Line or Text)
- LineThickness - Line, Rectangle, Ellipse, Star (NOT Text)
- DashStyle - Line, Rectangle, Ellipse, Star (NOT Text)

- 4. All share in Base class (Drawable)
 - Some share in Intermediate parent class (Shape, FilledShape)
 - Not share is only in that specific class (Text, Star)

6.2
